- ▶ and **Many Others**

Many differences exist between
these alternatives and Ansible.
We will review those differences later.

Tips, Tricks, & Pitfalls

How-To iterate over a list from a shell command:

> shell: /command/which/generates/lines
> register: output
> . . .
> when: item not in output.stdout_lines

Tips, Tricks, & Pitfalls

Store host specific variables in a host_vars folder.

Tips, Tricks, & Pitfalls

To only run a task when a list is **NOT** empty.

when: list|length > 0

Tips, Tricks, & Pitfalls

If your task hangs forever and is using sudo, confirm that you passed the:

–ask-sudo-pass

comand line option when you ran ansible.

Tips, Tricks, & Pitfalls

There are two ways to structure variables:

1. Dictionary: networking.interface.ip
   2. Scalar: networking_interface_ip

The drawback to dictionaries is: when you set a value somewhere else, it will replace the **whole** dictionary. It does not merge it.
